

This guide will show you how to configure Steam to use Http-Tunnel.

Once you have Http-Tunnel installed, run the application. The main window will appear, choose the configure option. There you will be presented with three (3) options.

1. You can Select Auto detect if you want Http-Tunnel to detect your settings.
2. No Proxy, only a firewall if this is appropriate.
3. Specify Proxy, Here you will enter the IP address and Port number of the proxy that you use.

Complete 1 of the 3 options, then click test, the client will bind to port 1080 and localhost ( 127.0.0.1 ) by default and connect to the tunnel servers if your settings are correct.

Download and install ProxyCap. Once you configure ProxyCap you may need to reboot. Configure Steam as suggested by the screen shots. There are 2 .exe files that will need to be included in Rules. The ' SteamService.exe ' can be found in the bin folder and Steam.exe can be found in the Steam Parent folder. Be sure to check both TCP and UDP for both rules. Click the OKs as you exit. Exit Steam, Exit ProxyCap and exit the Tunnel Client. Start ProxyCap, Start the Tunnel client then start Steam from the Steam client icon. If you do not connect to the steam servers then exit Steam and rotate to another server in the tunnel client. ( This has worked for me. ) Then start Steam again. See the Tips on How to rotate servers. Tips <http://forums.http-tunnel.com/showthread.php?t=2145>
