Featured K3E of the Month

Pictured Below:

Curt was using a bin to prop up his boards for soldering and the top of the bin often got in the way of the components on the other side of the board. This required the board to be repositioned several times during the assembly process. Curt assisted by drawing a potential solution on a scrap piece of paper. It was then 3D printed and tested. The new holder saves labor time per board due to its ability to minimize the need for repositioning.
