**Reform of Modern Science. Politics. Economics**

This book was made in the program of the Reform Science Center. It includes three articles concerned with the general methodology of the reform and its application to politics and economics. Reforming modern science leads to its thorough revision giving birth to a new science – *reform science*. Reform science has a structure common for all branches of science, which allows to introduce classification of concepts, thus purifying, perfecting and organizing the whole science.

The science of politics studies human society as an integral developing entity. In contrast to numerous works of the so-called *political science*, based mainly on the analysis of historical facts, this work is based on arranging in a systematical, logical order the knowledge about the main stages of human society, predicting possibly its future development.

Economics is the science studying the social system of goods production and has a long history. Its revision with the above new method has enabled us to introduce new concepts and receive new results. This book contains a short account of the logical structure of economics and is expected to be discussed and enlarged by relevant examples and supplements.
