

Evidences of the existence of Aether

GRAVITONS-AETHER

(It is an English translation of a German text)

(Short synthesis of current theories)

Link: the text of this page for printing

In the search for the truth about our world, sometime we reach automatically to a point where we have to answer these questions: "Is there Aether?"...and if so, what is this Aether? "

By the end of the nineteenth century the element Aether was recognized and accepted by scientists as a necessary medium for the transmission of different waves, simply because logic commanded it. At this point, however, something happened that forced the world of science to rethink. *The Michelson-Morley Experiment* "erroneously proved" that there is no Aether. The basic idea was that the speed of two light beams, emitted in different directions, would have to be different because the element Aether would have to slow down the one beam (emitted parallel to the Earth's orbit). At the starting point of the experiment, two beams were separated from the same light source and emitted in two different directions. Finally, both beams were recombined by means of mirrors, but the resulting interference pattern did not yield any difference in speed, leading to the idea that there is no Aether. The science of the nineteenth century had nothing to counter this conclusion, and thus the scholars had to reject the concept of the Aether, although this was contrary to any logic. What was wrong here was the assumption that the Aether beam must decelerate as any known medium does. Subsequent experiments led to the assumption that the Aether beam does not slow down due to its almost infinite flexibility, but these experiments have not been as resonant as *the Michelson-Morley Experiment*.

One of these later experiments (actually a long series of experiments) which proved the existence of the Aether was carried out by the *Russian astronomers Nasonov* and *Kosyrev* in the late 1970s and lasted for about 5 years. With the help of a crystal detector, cultured in space, and a large telescope, astrometric intensity profiles of many galaxies were generated. These intensity profiles looked quite different than expected! Everyone knows how a galaxy looks: the brightness is very large in the middle and decreases to the edge. The intensity profiles developed by the *Russian astronomers* looked reversed: they were weak in the middle of the galaxies and much stronger on the edge. What the crystal detector responded to was not the light, but something else - and it also responded as the opening of the telescope was covered!!! To exclude external influences, it was repeatedly electromagnetically shielded, but the reaction was still there! The logical conclusion was: the detector receives gravitational waves, because **only the gravitational force permeates everything**. This was associated with the strange intensity profiles in conjunction, and this resulted in an unbelievable new conclusion: gravitation is a medium (**the long-sought Aether = accumulation of gravitons**) that is absorbed more strongly by the many heavy stars in the middle of the galaxies than on their edges! For this reason, the intensity profiles generated were weaker in the middle, different than generally expected. (Source: "Space & Time") **Further experiments with this crystal detector revealed new, completely unexpected facts that disprove many widely accepted theories and turn almost all of the astrophysics upside down. Unfortunately, the bureaucracy started in the early 1980s and banned the astronomers from publishing further research results.**

But now back to the beginning of the 20th century. The exclusion of the Aether as a medium for the transmission of waves, especially of EM waves, led to one of the greatest riddles in science: **one suddenly no longer knew how waves (and in general, energy) were transferred.** To explain this, the concept of the physical field was invented, which still dominates science but is not clearly defined. **In short, you do not know what a field (magnetic, electrical) actually is. As in the case of the electric charge, one assumes axiomatically that there are fields without explaining what they are; it would be much easier to accept the Aether as a medium, simply because other media actually exist in nature.**

But it is not only logic that recommends the acceptance of the Aether as a subtle and all-pervasive medium, but also the necessity of explaining the functioning of different machines which do not run "according to the rules of official teaching." It is mainly about experiments involving the manipulation of gravity.

In the following are presented a pair of properties of the medium Aether which provide a good and logical explanation for the operation of such machines.

The Aether is a subtle continuum that fills the entire universe and permeates everything. More than that, the Aether is the "substance" that creates physical objects in compressed form. It also exists in free form, as "invisible, free and flowing Aether" and in bound form, as visible objects. On this assumption, everyday experiments are carried out in particle accelerators, where existing particles are accelerated with relative velocities; after impacting, these particles dissolve in pure energy, producing completely new particles as from "nothing". The newly born particles are not components of the old, but really new, born of pure energy (presumably from the Aether).

The free Aether is in constant motion. The natural tendency of the free, unbound Aether is to flow to the mass centers (stars, planets) of the universe and there to become visible matter. It has been proved by the official science (astrophysics) that the mass of the heavenly bodies is constantly growing, but without a good explanation for this growth. The common explanation is that light elements are burned in the process of hot fusion, which leads to the emission of different amounts of energy and the simultaneous generation of heavy elements. Even if the spectral analysis proves the existence of heavy elements in the stars, one cannot assume that only these elements are responsible for the growing mass of the stars. It is probable that only the volume will change, the total mass must always remain the same (example: 1 kg of wool = 1 kg of lead, only the volumes are not equal). According to the conservation law, a given quantity cannot become a larger quantity in the normal case, but not in the case of the interaction with Aether.

Now let us take the example of the earth. Everyone knows that in the course of time the continents have drifted apart, meaning they have separated from each other. This is also due to the growth of the earth's mass, which in turn has led to a growth of the volume. In the case of an air balloon, you can observe the same: if you paint several points on the balloon and then inflate the balloon, the distance between the points becomes bigger. Exactly the same happens with the continents, however, in a time span of millions of years.

In the case of stars, it is also obvious: although they constantly radiate vast amounts of energy into space, their masses grow continuously, in the final phase of their lives, their own so-called gravitational force forces them to shrink and ultimately to explode (the phenomenon of Novas and Supernovas) . Where does this mass come from?

Presumably, the following happens: the free Aether flows to the mass centers which consist of already bound and of materialized Aether, and becomes matter. This flow produces so-called pressure fronts which exert pressure on the bound Aether, which is felt as "weight". Gravitation is therefore not a force emitted by stars and planets but a flow of gravitons towards the stars and planets. This is actually logical: we are drawn to the earth and not repelled. The key to the manipulation of gravity is thus the Aether!

With the exclusion of the Aether as a real existing element and medium, science may have denied access to the "secrets" of gravitation itself!

The fact that the Aether actually exists and the gravitational force can be put "out of power" has also been proved by the anti-gravity experiment. The test model creates counter-pressure fronts that balance the natural pressure fronts of the incoming Aether and allow the model to take off. More than that, these pressure fronts can be emitted as desired, so that a horizontal movement is also possible. This proves once again that electromagnetism is only a special case of gravitation.

Another proof of the real existence of the ether is the fact that material bodies have their own inertia. How to explain inertia? **Mach's theory** seems to be very unrealistic; after it has been accepted for decades; more and more voices from science are rising against it, just because it can no longer explain the latest findings. In fact, the Aether-medium can explain the inertia of the body much better: every material object also possesses a lot of free Aether which is carried along with it and permeates the object and envelops it. Its own free Aether acts as a "buffer" between the object and the surrounding Aether. When the object is accelerated, its own Aether portion remains somewhat behind, and it is exposed "naked" to the outer Aether, which exerts a force on it. In addition, the own Aether body "sucks" the object, and this suction force must be balanced with consumption of energy (e.g., with gasoline combustion). Of course, the Aether's own part (Aetheric body) immediately follows and adapts the movement, so that after reaching a certain velocity the object can move freely as long as it is not further accelerated. The "Aetheric body" of the object moves with it and protects it against external influences, thanks to its buffer function. When braking, however, the object is again pulled out of its Aetheric body, this time backwards. The Aetheric body that had adapted to the previous movement sucks it forward further, so the object cannot be instantly braked, but moves forward for a while.

!!! However, when braking is performed with a power-generating system, strangely more energy is generated than required for acceleration. This is the decisive proof that there is another element in the game that adds this additional amount of energy: the Aether!

Practical applications in the field of energy generation can no longer be excluded and it is only a matter of time until someone succeeds in producing the first mechanical energy generator based on the Aether.

Note: there is of course no claim to completeness for this synthesis.

Why the existence of Aether is logical?

A logical approach for the purpose of supporting a scientific claim (for example: the existence of Aether) should preferably be based on geometrical and /or mathematical rules and principles.
